The global Carbon Emissions Data Management Information System market size is expected to reach \$ 864 million by 2032, rising at a market growth of 11.5% CAGR during the forecast period (2026-2032).

A Carbon Emissions Data Management Information System is a specialized information management system designed for the collection, storage, processing, analysis, and reporting of carbon emissions-related data for organizations, projects, or products. Based on established carbon accounting standards—such as ISO 14064, the GHG Protocol, and national MRV frameworks—this system leverages structured databases and standardized workflows to facilitate the end-to-end digital management of processes ranging from carbon source identification and activity data entry to emission factor management, emissions calculation, data quality control, and report generation. Its core functionalities encompass ledger management and historical traceability of carbon emissions data; multi-dimensional statistical analysis and benchmarking; data quality assurance and verification support; and integration interfaces with carbon trading systems and ESG disclosure platforms. The objective behind the development of this system is to ensure the accuracy, completeness, consistency, and traceability of carbon emissions data, thereby providing a reliable data infrastructure to support corporate carbon asset management, government carbon regulation, and the efficient operation of carbon markets.
