Abstracts

The global Carbon Fiber for Fishing Rods market size is expected to reach \$ 289 million by 2032, rising at a market growth of 6.9% CAGR during the forecast period (2026-2032).

In 2025, global Carbon Fiber for Fishing Rods sales reached approximately 6,740 tons , with an average global market price of around US\$ 25.8 per kg. Carbon Fiber for Fishing Rods refers to lightweight, high-strength carbon fiber materials specifically designed for manufacturing fishing rod blanks and structural components. These materials are commonly supplied as continuous filament tow, unidirectional sheets, woven fabrics, carbon tapes, or epoxy-based preregs. Manufacturers combine different fiber strengths, elastic moduli, orientations, resin contents, and layer thicknesses to control rod weight, stiffness, sensitivity, flexibility, recovery speed, casting distance, vibration transmission, and impact resistance. Carbon fiber is widely used in spinning rods, casting rods, fly rods, telescopic rods, surf rods, ice-fishing rods, and offshore fishing rods for recreational and professional applications. The industrial chain of Carbon Fiber for Fishing Rods begins with acrylonitrile, polymer precursors, spinning chemicals, sizing agents, epoxy resins, curing agents, additives, release films, and packaging materials. Upstream production includes precursor spinning, stabilization, carbonization, surface treatment, sizing, weaving, fiber spreading, resin formulation, and prepreg manufacturing. Midstream processors perform material slitting, pattern cutting, mandrel wrapping, multilayer layup, heat curing, mandrel removal, grinding, coating, guide installation, inspection, and rod assembly. Downstream applications include recreational fishing rods, professional angling equipment, competitive fishing rods, customized rods, and replacement rod blanks. Supporting activities include material testing, structural simulation, quality certification, logistics, recycling, and technical services.

The Carbon Fiber for Fishing Rods market is supported by increasing participation in recreational fishing and growing demand for lightweight, sensitive, durable, and high-performance fishing equipment. Carbon fiber allows rod manufacturers to precisely adjust stiffness, flexibility, recovery speed, casting distance, vibration transmission, and impact resistance through fiber-grade selection and optimized laminate structures. High-strength and intermediate-modulus fibers remain widely used, while high-modulus fibers, ultra-thin prepregs, spread-tow materials, nano-modified resins, and hybrid carbon-glass structures are gaining adoption in premium rods. Demand is also increasing for specialized materials used in saltwater, offshore, fly-fishing, telescopic, and competitive fishing applications. Manufacturers are improving prepreg consistency, reducing resin content, shortening curing cycles, and developing automated wrapping processes. However, high material costs, energy-intensive carbonization, complex quality control, impact-damage risks, and competition from fiberglass and composite rods may restrict expansion. Rising fishing participation, product premiumization, and material innovation are expected to support stable long-term growth.
