Abstracts

The global Carbon Fiber Composite Core Wire market size is expected to reach \$ 780 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

Carbon fiber composite core wire is a new type of conductor for overhead transmission lines, which is composed of a conductive core composed of carbon fiber and an annular conductive layer. The core is a conductive core made of carbon fiber. The annular conductive layer is composed of copper, aluminum, and aluminum alloy wires tightly wrapped around the periphery of the core. An insulating layer can also be wrapped around the annular conductive layer. This structure makes the carbon fiber composite conductor have light weight, high tensile strength, good heat resistance, small thermal expansion coefficient, small sag at high temperature, high conductivity, low line loss, large carrying capacity, good corrosion resistance, and not easy to be covered with ice. and a series of advantages.

The upstream sector primarily encompasses large-tow or medium-to-high modulus carbon fiber, glass fiber, high-temperature resistant epoxy resins (or other high-performance resin matrices), aluminum rods/electrical round aluminum wire, heat-resistant aluminum alloy wire, aluminum cladding materials, terminal fittings, splicing sleeves, tension clamps, and vibration-damping fittings. Among these, carbon fiber determines the core material's strength, modulus, and thermal expansion characteristics; the resin system dictates temperature resistance, aging resistance, and interfacial stability; aluminum purity and wire profile determine electrical conductivity and current-carrying capacity; and the fittings system directly impacts installation reliability and long-term operational safety.

Global sales volume is projected to reach approximately 38,000 kilometers in 2025, with

a mainstream ex-factory price of roughly 12-15 USD per meter and gross profit margins for leading manufacturers ranging from approximately 25% to 40%.

Industry demand for carbon-fiber composite-core conductors is primarily driven by grid capacity upgrades, the transmission of renewable energy, rising loads on urban power grids, and constraints on transmission corridor resources. Compared to constructing new lines, replacing traditional steel-reinforced aluminum conductors (ACSR) with carbon-fiber composite-core conductors allows for increased ampacity and reduced sag and line losses while utilizing existing towers and rights-of-way; consequently, they offer significant value for UHV and high-voltage transmission lines, urban grid upgrades, and long-span crossings. However, industry adoption faces hurdles: higher initial costs compared to conventional conductors; stringent requirements regarding composite core quality stability, end-fitting compatibility, installation techniques, and long-term operational reliability; and lengthy validation periods required by grid operators. As a result, they are unlikely to fully replace traditional ACSR in the short term. Overall, carbon-fiber composite-core conductors are best suited for key applications involving high loads, corridor constraints, low-sag requirements, and capacity upgrades. The market is expected to transition gradually from demonstration projects to large-scale adoption, with the pace of growth contingent on the intensity of grid investment, reductions in product costs, the accumulation of operational data, and the maturation of industry standards.
