## Abstracts

According to our (Global Info Research) latest study, the global Carbon Fiber Satellite Communication Antenna market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Carbon fiber composite materials are composite materials with resin as the matrix and carbon fiber as the reinforcement. They have the characteristics of light weight, high modulus, and low thermal expansion coefficient. Carbon fiber itself is conductive, can transmit or receive antenna electromagnetic waves within a certain frequency range, and can withstand a certain power. Therefore, antennas made of carbon fiber composite materials can not only ensure the electrical performance of the antenna, but also have light weight, high specific strength, strong resistance to shock and vibration, and can withstand the test of harsh environments such as high and low temperature cycles and thermal vacuum.
