The polyaromatic ring structure compound formed by asphalt after cross-linking and curing is similar in structure to graphite material, with strong binding force, which improves the compatibility between negative electrode material and electrolyte, prevents co-intercalation of solvents, decomposition and stripping of graphite structure, and has high The reversible electrochemical capacity improves the initial Coulombic efficiency and cycle stability of the anode material. Asphalt is further divided into coal-based asphalt and petroleum-based asphalt. After graphitization, the petroleum-based asphalt has a higher gram capacity and lower pollution emissions. Therefore, the current negative electrode carbon coating is based on petroleum-based asphalt.
