## Abstracts

The global Carbon Fiber X-ray Bed Board market size is expected to reach \$ 137 million by 2032, rising at a market growth of 6.9% CAGR during the forecast period (2026-2032).

In 2025, global sales of carbon fiber X-ray bed boards reached 16,000 units, with an average selling price of US\$5,200 per unit. Carbon fiber X-ray bed boards are specialized examination bed boards used in medical imaging equipment. Made of high-strength carbon fiber composite materials, they feature extremely low X-ray absorption, high load-bearing capacity, and good structural rigidity, enabling high-quality image scanning while ensuring patient safety and comfort. They are widely used in medical settings such as CT, digital X-ray, interventional imaging, and radiotherapy. The bed boards typically consist of carbon fiber laminates, an aluminum alloy support frame, and surface anti-slip materials, combining lightweight design with durability. Upstream raw materials mainly include carbon fiber cloth, epoxy resin, aluminum profiles, and composite auxiliary materials. Upstream suppliers are primarily carbon fiber manufacturers, resin suppliers, and metal processing companies. Downstream markets include hospitals, imaging centers, and medical equipment manufacturers. The global industry's total production capacity is approximately 22,000 units, with a gross profit margin of approximately 28%. With the increasing demands for low-absorption, high-precision, and lightweight bed boards from medical imaging equipment, and the rapid expansion of the interventional imaging and high-end diagnostic markets, carbon fiber X-ray bed boards have stable demand and continuous growth opportunities in the fields of high-end medical equipment support, hospital upgrades and renovations, and new imaging centers. In the future, the products will develop towards higher strength, intelligence, and customization.

The carbon fiber X-ray bed board market is showing a steady growth trend, primarily driven by upgrades in medical imaging equipment and improvements in hospital diagnostic and treatment capabilities. With the increasing prevalence of digital X-ray systems, CT equipment, and interventional radiotherapy equipment, medical institutions are demanding lower radiation absorption, higher strength, and lighter bed boards. Carbon fiber composites, due to their excellent transmission properties and structural stability, are gradually becoming the mainstream material for high-end imaging equipment bed boards. Simultaneously, the development of minimally invasive interventional surgery and precision radiotherapy technologies is raising the requirements for image clarity and patient positioning stability, further promoting the application of carbon fiber bed boards in high-end medical equipment. Regionally, North America and Europe have stable demand in the high-end medical equipment sector, while the Asia-Pacific region is experiencing more significant market growth due to accelerated medical infrastructure construction and hospital equipment upgrades. Industry competition is shifting from single-product manufacturing to material R&D capabilities, composite material structural design capabilities, and collaborative development capabilities with medical equipment manufacturers.

In the future, as medical imaging equipment develops towards higher precision, lighter weight, and greater intelligence, the application space for carbon fiber X-ray bed boards in high-end CT equipment, interventional imaging systems, and radiotherapy equipment will continue to expand.

This report studies the global Carbon Fiber X-ray Bed Board production, demand, key manufacturers, and key regions.
