## Abstracts

The global Carbon Footprint Management System market size is expected to reach \$ 25484 million by 2032, rising at a market growth of 6.8% CAGR during the forecast period (2026-2032).

Carbon Footprint Management System refers to a software platform or 'software + service' solution used to systematically collect, calculate, analyze and manage greenhouse gas (GHG) emission data. Its goal is to quantify carbon emissions at the enterprise, product or supply chain level, meet compliance disclosure requirements, and support emission reduction decisions and continuous improvement.

### Gross Profit Margin Levels

The gross profit margin of carbon footprint management systems exhibits a typical characteristic of 'high for software, low for services, and a hybrid margin depending on the delivery structure.' For pure SaaS products primarily based on subscriptions, the industry benchmark is a 70%-85% gross profit margin, as delivery costs mainly consist of cloud resources, factor library maintenance, and customer success. When vendors package data cleansing, supply chain reporting, verification preparation, and long-term managed operations, the gross profit margin is lowered by 'professional services and implementation delivery,' resulting in a hybrid gross profit margin of approximately 50%-70%. Service-oriented revenue, primarily focused on integration, implementation, and consulting delivery, typically has a significantly lower gross profit margin. For example, large professional service companies like Accenture have a gross profit margin of around 32% according to their financial statements, reflecting the rigidity of human-intensive delivery costs.

### Industry Drivers

The core drivers of carbon footprint management systems stem from the combined forces of regulatory compliance, supply chain transmission, and trade mechanisms. Firstly, disclosure standards are pushing Scope 1/2/3 from 'optional' to 'quasi-

mandatory.' For example, ISSB's IFRS S2 explicitly requires disclosure of emissions across all three scopes and aligns with the GHG Protocol methodology; the EU's ESRS E1 also requires disclosure of Scope 1/2/3 and provides more detailed disclosure for the important Scope 3 category?directly forcing companies to build auditable data links and systematic workflows. Secondly, border adjustment mechanisms such as CBAM require the declaration of implicit emissions from imported products and the assumption of corresponding costs once the system matures, shifting 'product and supply chain carbon data' from an ESG narrative to a trade and cost factor. Thirdly, various economies are also establishing local carbon footprint standard systems (for example, China has proposed establishing a preliminary carbon footprint management system and formulating accounting standards for key products by 2027), further strengthening the need for 'multi-caliber compliance and multi-regional data consistency.' Under these external pressures, companies will naturally purchase or upgrade CFMS to reduce compliance risks, improve supply chain collaboration efficiency, and re-link emissions reduction investments with operating metrics (costs, orders, financing).
