According to our (Global Info Research) latest study, the global Carbon Management Software market size was valued at USD 11990 million in 2023 and is forecast to a readjusted size of USD 27460 million by 2030 with a CAGR of 12.6% during review period.

Carbon management software is a tool that aids organizations in planning and implementing their carbon management strategies. Carbon management tools help organizations accurately measure and reduce their carbon footprints, meet their objectives of corporate sustainability, and fulfill government mandates. The increasing amount of GHG emissions is a major concern for many organizations across the globe. Among the various harmful GHGs, CO₂ is one of the most harmful, and it requires considerable effort, such as measuring and monitoring its levels, to reduce its emission. It helps measure, plan, manage, store, and report carbon emissions related to various organizational activities.

Extensive research conducted during the past two decades has provided conclusive evidence that the emission of greenhouse gases is the main cause of global warming. The drastic rise in the levels of CO₂ for the past 30 years can be attributed mainly to the burning of fossil fuels. Currently, more than 60% of the energy demand is met by burning fossil fuels, like coal, oil, and gas. The demand for energy is relatively high compared to the adoption of alternative sources of energy. This is driving the demand for burning fossil fuels to sustain the growing energy demand. This trend is expected to continue in the forecast period.
