According to our latest research, the global Carbon Mineralization market size will reach USD 767 million in 2031, growing at a CAGR of 9.9% over the analysis period.

Carbon mineralization is a natural or engineered process in which carbon dioxide (CO₂) reacts with minerals, particularly silicate or carbonate rocks, to form stable solid carbonates. This process permanently traps CO₂ in a solid form, making it a promising solution for long-term carbon sequestration to mitigate climate change. It can occur naturally over geological timescales or be accelerated through industrial methods in engineered settings, such as injecting CO₂ into basalt formations or using it to enhance building materials like concrete. Carbon mineralization offers a durable and scalable approach to reducing atmospheric CO₂ levels while providing potential byproducts for industrial use.
