According to our (Global Info Research) latest study, the global Carbon Nanohorn?CNH? market size was valued at US\$ 19.55 million in 2025 and is forecast to a readjusted size of US\$ 51.06 million by 2032 with a CAGR of 14.6% during review period.

In 2025, global sales volume of Carbon Nanohorn (CNH) was approximately 2 tons, with an average global market price of about USD 9,500/kg. Gross margins of major industry producers were generally in the range of 45%?65%.

Carbon Nanohorn (CNH) is a horn-shaped or cone-shaped nanoscale carbon material formed by the curling of graphene sheets. It features high specific surface area, hierarchical pore structure, good electrical conductivity, strong chemical stability and relatively low metal impurity content, providing abundant adsorption sites and loading space while facilitating electron transport, ion diffusion and interfacial reactions. Compared with conventional carbon nanotubes, Carbon Nanohorn places greater emphasis on pore structure and surface modifiability. Its dispersibility, adsorption capacity, catalytic loading capability and biocompatibility can be further improved through oxidation, pore-opening, loading or other surface modification processes.

The upstream of Carbon Nanohorn mainly includes high-purity graphite, inert gases, purification reagents, dispersion media and surface modification agents. The midstream involves the preparation of Carbon Nanohorn powder through methods such as laser ablation and arc discharge, followed by optional pore-opening, oxidation, dispersion and composite loading treatments. Downstream applications mainly include electrochemical energy, catalyst supports, adsorption and storage, biomedicine, sensing and

electronics. Product value is primarily concentrated in morphology control, pore structure regulation, purity stability and surface modification capability.
