The global Carbon Nanotube (CNT) Paste market size is expected to reach \$ 14519 million by 2032, rising at a market growth of 28.0% CAGR during the forecast period (2026-2032).

Carbon nanotube (CNT) paste is a liquid or slurry-like functional material prepared using carbon nanotubes (single-walled or multi-walled CNTs) as the main filler through dispersants, solvents, or resin systems. Its core function is to form a continuous conductive network or enhance material properties, improving electron transport efficiency, electrical conductivity, thermal conductivity, or mechanical properties, while also considering processability and compatibility with coating, printing, or composite processing techniques. Carbon nanotube pastes are widely used in lithium-ion batteries, electromagnetic shielding, printed electronics, conductive plastics, functional composite materials, and semiconductors. They can be optimized based on parameters such as CNT type, purity, diameter, specific surface area, and solid content to meet the performance requirements of different applications. In 2025, global shipments of Carbon Nanotube (CNT) paste reached approximately 640,200 tons, with an average price of approximately US\$4,496.8 per ton. Single-walled carbon nanotube paste was priced at approximately US\$22,857.14 per ton, while multi-walled carbon nanotube paste was priced at approximately US\$2,571.42 per ton, with gross profit margins ranging from 40% to 50%.

Conductive agents, as key auxiliary materials for lithium-ion batteries, account for a limited percentage of the cost but have a significant impact on battery performance. Commonly used conductive agents for lithium-ion batteries mainly include traditional conductive agents (carbon black, conductive graphite, carbon fiber, etc.) and novel conductive agents (carbon nanotubes, graphene, and their mixed pastes, etc.). With

technological maturity, carbon nanotube conductive pastes are gradually replacing traditional conductive agents, becoming the mainstream choice for power batteries and energy storage batteries. Due to their relatively small proportion of the overall cost, customers are less sensitive to CNT prices, giving them a stable market space in high-end applications. Carbon nanotube slurry is expected to continue to grow in the future along with the development of the lithium battery and functional electronic materials market, and drive the industry toward high-tech added value.
