The global Carbon Nanotube Conductive Paste market size is expected to reach \$ 14519 million by 2032, rising at a market growth of 28.0% CAGR during the forecast period (2026-2032).

Carbon nanotube conductive pastes are a class of functional materials prepared in liquid or slurry form using carbon nanotubes as the main conductive filler through dispersants, solvents, or resin systems. Their core function is to form a continuous conductive network, improving electron migration efficiency while maintaining good processability. They can be applied in coating, printing, or lithium-ion battery electrode pastes. Carbon nanotubes possess excellent electrical, mechanical, and chemical properties, significantly improving the conductivity, thermal conductivity, and structural properties of materials. Adding CNTs to lithium-ion batteries can enhance energy density, rate performance, and cycle life, making them a representative of novel conductive agents. Besides lithium-ion batteries, CNT conductive pastes can also be applied in other fields, such as printed electronics, electromagnetic shielding, conductive composite materials, and semiconductors. In 2025, global shipments of Carbon Nanotube Conductive Paste (CNT) reached approximately 640,200 tons, with an average price of about US\$4,496.8 per ton. The price of single-walled CNT slurry was approximately US\$22,857.14 per ton, and that of multi-walled CNT slurry was approximately US\$2,571.42 per ton, with gross profit margins ranging from 40% to 50%.

Conductive agents, as key auxiliary materials for lithium-ion batteries, account for a limited percentage of the cost but have a significant impact on battery performance. Commonly used conductive agents for lithium-ion batteries mainly include traditional conductive agents (carbon black, conductive graphite, carbon fiber, etc.) and novel conductive agents (carbon nanotubes, graphene, and their mixed slurries, etc.). With

technological maturity, carbon nanotube conductive slurries are gradually replacing traditional conductive agents, becoming the mainstream choice for power batteries and energy storage batteries. Due to their relatively small proportion of the overall cost, customers are less sensitive to CNT prices, giving them a stable market space in high-end applications. Carbon nanotube slurry is expected to continue to grow in the future along with the development of the lithium battery and functional electronic materials market, and drive the industry toward high-tech added value.
