Carbon Steel Hydropneumatic Tanks are storage containers mainly made of carbon steel. They combine the principles of hydraulics and pneumatics and are used to store and regulate liquid or gaseous media. In a hydraulic system, it can serve as an accumulator. By taking advantage of the compressibility of gas (such as nitrogen), energy is stored. When the system pressure changes, the gas is compressed or expands, thus balancing the system pressure, reducing pressure fluctuations, and absorbing hydraulic shocks. In a pneumatic system, it can also store a certain amount of compressed gas and play a role in buffering, stabilizing the pressure, and regulating the gas flow. The carbon - steel material endows the tank with high strength and toughness, enabling it to withstand a certain amount of pressure.
