## Abstracts

Cardiac assist equipment (CAD) is a mechanical pump that works with the heart to improve its pumping efficiency and maintain optimal blood flow throughout the body. Cardiac assist devices are used to treat advanced heart failure and are determined by individual needs. These designs are used to take over the function of the heart and help it function normally when it becomes weak. Cardiac assist devices are divided into three types: ventricular assist devices, intra-aortic balloon pump (IABP) and fully artificial heart. The ventricular assist device is implanted in the chest of the patient and consists of an electric motor and a power transmission system. It pumps blood through the heart to the entire body and has the power needed to distribute enough blood throughout the body. The intra-aortic balloon pump is an elongated, elongated balloon that controls the blood flow through the aorta of the largest blood vessel. The device expands and contracts according to the blood flow. When the heart beats, it becomes smaller so that blood can flow to other parts of the body. When the heart relaxes, it will become larger in order to retain more blood in the heart.
