According to our (Global Info Research) latest study, the global Cardiac Defibrillators market size was valued at USD 12060 million in 2023 and is forecast to a readjusted size of USD 15370 million by 2030 with a CAGR of 3.5% during review period.

Defibrillation is a common treatment for life-threatening cardiac dysrhythmias, ventricular fibrillation and pulseless ventricular tachycardia. Defibrillation consists of delivering a therapeutic dose of electrical energy to the heart with a device called a defibrillator. This depolarizes a critical mass of the heart muscle, terminates the dysrhythmia and allows normal sinus rhythm to be reestablished by the body's natural pacemaker, in the sinoatrial node of the heart. Defibrillators can be external, transvenous, or implanted (implantable cardioverter-defibrillator), depending on the type of device used or needed. Some external units, known as automated external defibrillators (AEDs), automate the diagnosis of treatable rhythms, meaning that lay responders or bystanders are able to use them successfully with little or no training at all.

North America accounted for a significant share of the overall market in 2016. This contribution can be attributed to increasing incidence of cardiovascular diseases, supportive government policies, favorable reimbursement schemes, increasing awareness, and increase in training programs.

Asia Pacific was identified as the fastest growing market for defibrillators. Tremendous growth opportunities are observed in this region due to increasing awareness and accessibility of these devices. In addition, increasing prevalence of cardiovascular diseases in this region also supports growth of this segment.
