## Abstracts

Cardiac output is known as the volume of blood is pumped by from the right or left ventricle of heart per minute and which is dependent on heart rate, and stroke volume. The cardiac output increases during acute exercise and mental stress, while decreased cardiac output might include physical exercise of a intensity that the patient is not able to bear because of decrease in oxygen supply, obesity, ingestion of large meals that place an added workload on the heart, retention of fluid, emotional stress, hypervolemia, and smoking. It is essential to assess the state of patient's blood circulation. Low cardiac output usually leads to a common problem of low blood pressure which might surface occur during surgery, or during postoperative care in the intensive care units.
