A pacemaker is a small device that sends electrical impulses to the heart muscle to maintain a suitable heart rate and rhythm. Pacemaker generates an electrical impulse that passes through the leads (wires) to the heart muscles. This causes the heart muscles to contract, thus creating a heartbeat. A pacemaker may also be used to treat fainting spells (syncope), congestive heart failure, and, rarely, hypertrophic cardiomyopathy. These devices are used for regulating the heartbeat of individuals and are segmented into products such as implantable cardiac pacemakers and external cardiac pacemakers.

Scope of the Report:
