## Abstracts

Cardiac safety assessment is an important, animal or animal tissue-based experimental procedure that must be considered before entering into clinical trials. In the past few years, some drugs that have been put into clinical use have had to be withdrawn from the market or their approval has been delayed because of their potential cardiotoxicity or causing severe cardiac arrhythmias.

According to our (Global Info Research) latest study, the global Cardiac Safety Assessment Services market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Drug-induced cardiotoxicity is one of the main reasons for the termination of research and development of new drugs or their removal from the market. Therefore, cardiac safety assessment is a mandatory experimental procedure for various new drugs to enter clinical trials. At present, 'hERG assay (hERG Assay)' (hERG assay is to evaluate the inhibitory effect of drugs on hERc current in stably expressing cell lines) is considered to be the current gold standard for preclinical cardiac safety evaluation, and is also required by FDA for new drug approval. Prepare data.
