Abstracts

According to our (Global Info Research) latest study, the global Cardiac Ultrasound Transducers market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Ultrasound machines are very valuable tool in healthcare diagnostic but they need transducer to capture the image. Ultrasound transducers works in a similar way as sonar or radar. Ultrasound transducers produce sound waves that bounce of body tissue and organs and make echoes. Ultrasound transducers have three elements: transmitter, receiver and trans-receiver. Transducer receives echoes and send them to computer which create picture of echoes called as sonogram. These transducers have one or more quartz crystals know as piezoelectric crystals. When electric current pass through these crystals they change shape. Due to change in shape sound waves are produced. Cardiac ultrasound transducers comes into different size and shapes.

Ultrasound machines cannot be operated without the use of transducers or probes. Increasing prevalence of cardiac disease is driving the growth of cardiac ultrasound transducer market. Ultrasound machines proved real-time imaging compared to other imaging systems such as compute tomography, MRI and others. The speed, efficacy and cost-effectiveness of ultrasound is driving the growth of cardiac ultrasound transducers market. Technological advancement in cardiac ultrasound transducers is also another factor.
