According to our (Global Info Research) latest study, the global Cardiology Electrodes market size was valued at USD 511.5 million in 2023 and is forecast to a readjusted size of USD 663.6 million by 2030 with a CAGR of 3.8% during review period.

Electrocardiography is the process of recording the electrical activity of the heart over a period of time using electrodes placed on the skin. These electrodes detect the tiny electrical changes on the skin that arise from the heart muscle's electrophysiologic pattern of depolarizing and repolarizing during each heartbeat. It is very commonly performed to detect any cardiac problems.

The rising incidence of cardiovascular diseases in the geriatric population as well as in some young people will propel the growth of this market during the forecast period. In 2014 alone, the American Heart Association reported that over 17 million deaths were caused by cardiovascular problems. Cardiology electrodes are an essential part of the diagnostics process, and innovations will help detect problems early and faster. Patients who get tests done find it easier to get reimbursed for their ECG tests. This bolsters growth prospects for the global cardiology electrodes market during the forecast period.
