The global Carotenoids for Poultry Feed market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Carotenoids for poultry feed are additives that can help improve the productivity and health of poultry. The market for carotenoids in poultry feed is driven by the need to enhance the nutritional value of feed and promote the growth and development of poultry, especially in the case of egg-laying hens and broiler chickens. Carotenoids are natural pigments that are commonly found in plants, and are responsible for the red, orange, and yellow hues of fruits and vegetables. They are also present in some animal products such as eggs and fish.

Carotenoids are added to poultry feed as they are known to enhance the immune system, promote growth, improve egg quality, and improve the color of egg yolks and chicken meat. The market for carotenoids for poultry feed is also driven by the increasing consumer demand for high-quality, healthy, and safe poultry products. The major types of carotenoids used in poultry feed include beta-carotene, lutein, astaxanthin, and canthaxanthin. The market for carotenoids for poultry feed is expected to continue to grow in the coming years as the demand for high-quality and nutritious poultry products increases.
