Abstracts

According to our (Global Info Research) latest study, the global Carrageenan market size was valued at US\$ 1146 million in 2025 and is forecast to a readjusted size of US\$ 1456 million by 2032 with a CAGR of 3.5% during review period.

Carrageenan (also known carrageenin) is a family of linear sulphated polysaccharides that extracted from red seaweeds such as eucheuma cottonii, eucheuma spinosum, etc., with an ability to form gel, stabilize, thicken, emulsify, film, which applied as gelling, thickening, stabilizing, emulsifying or suspending agent in food, daily chemical and pharm industry. In 2024, global Carrageenan production reached approximately 120 K MT, with an average global market price of around US\$ 8963 per MT.

The carrageenan market is a mid-sized, steadily expanding segment of the global hydrocolloids industry, with current estimates placing its value around the USD 1 billion mark and forecasting single-digit annual growth over the next decade. Derived from red seaweeds, carrageenan functions primarily as a gelling, thickening and stabilizing agent and is widely used in dairy products, plant-based milks, processed meats, confectionery, sauces, pet food, toothpaste and a range of personal care and pharmaceutical formulations. It competes and coexists with other hydrocolloids such as agar, xanthan, guar and pectins, but holds a strong position in applications where its specific gel textures, protein reactivity and clean-label, plant-based image are valued. Demand is driven by both mature markets (Europe, North America, East Asia) and fast-growing emerging economies where processed foods, convenience products and modern retail are expanding.

Along the industry chain, the upstream segment is rooted in seaweed farming and wild collection, especially of species such as Kappaphycus and Eucheuma, cultivated mainly

in coastal regions of Southeast Asia, East Africa and parts of Latin America. Smallholder farmers and cooperatives typically harvest and sun-dry seaweed, which is then sold to traders and primary processors that clean, grade and bale the dried raw material. Midstream, carrageenan processors use alkali treatment and extraction technologies (e.g., alcohol precipitation, gel-press, and semi-refined processes) to convert dried seaweed into semi-refined and refined carrageenan, adjusting conditions to produce kappa, iota or lambda types tailored to specific performance needs. Further downstream, ingredient blenders and formulators combine carrageenan with other stabilizers, salts and functional ingredients to create ready-to-use systems for dairy, meat, plant-based, confectionery and personal care applications, which are then incorporated into finished consumer products by food, beverage, pet food and cosmetics manufacturers.

The main driving factors for carrageenan demand are the global push toward natural, plant-based and clean-label ingredients, the growth of processed and convenience foods (including plant-based dairy and meat alternatives), and the need for robust texture and stability solutions that work across complex formulations and cold chains. At the same time, the industry must navigate headwinds such as competition from alternative hydrocolloids, occasional scrutiny over safety perceptions, and vulnerability to climate, disease and geopolitical risks in seaweed-producing regions, which can affect raw-material availability and pricing. Balancing solid structural demand with these supply and competitive pressures, carrageenan producers and formulators typically achieve moderate to relatively high gross profit margins, most commonly in the range of about 20-35%, with margins toward the upper end for higher-purity grades and specialized functional systems and toward the lower end for bulk semi-refined products that compete more heavily on price.
