According to our (Global Info Research) latest study, the global Carrier Copper Foil market size was valued at US\$ 797 million in 2025 and is forecast to a readjusted size of US\$ 1661 million by 2032 with a CAGR of 11.2% during review period.

Carrier copper foil is a type of 'supporting copper foil' used in functional materials or composite electrode systems. It typically involves introducing a reinforcing layer or carrier structure onto a traditional copper foil base to improve its mechanical properties or process compatibility.

The upstream of the industry chain mainly includes high-purity electrolytic copper, rolled copper billets, and related chemical additives and base film materials (such as polyimide and other carrier substrates). It also relies on high-end electrolytic/rolled copper foil production equipment and surface treatment agents. The midstream is the carrier copper foil manufacturing stage, which uses processes such as ultra-thin copper foil preparation, surface microstructure treatment, composite carrier layer lamination, or temporary carrier structure construction to create functional copper foil products with high strength support and excellent conductivity. The downstream is mainly used in high-end electronics manufacturing, including IC packaging substrates, high-end PCBs and HDI boards, AI servers, and new energy.

In 2025, global carrier copper foil sales reached 62 million square meters, with a production capacity of approximately 100 million square meters, an average selling price of US\$12.5 per square meter, and an average gross profit margin of 30%-40%.

At the policy level, there are two main drivers: first, the push for self-sufficiency in the

semiconductor supply chain by various countries (especially the localization demand for advanced packaging materials in the US and Europe); and second, supportive policies for lightweight and high-energy-density materials in the new energy battery industry chain (such as the roadmap for improving the energy density of power batteries). Meanwhile, China is accelerating the localization of composite copper foil and high-end copper foil under the support of its 'domestic substitution of new materials' policy. In terms of industry dynamics, a significant upward price trend is expected around 2025, with high-end copper foil manufacturers (such as Mitsui Metals) raising prices multiple times, reflecting the pressure on supply from demand for AI servers and high-end PCBs. At the same time, global copper price fluctuations are further amplifying the industry's profit elasticity.
