## Abstracts

The global Cast Iron Timing Pulley market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A cast iron timing pulley is a mechanical element used in a transmission system, usually made of cast iron, and used in conjunction with a timing belt to transmit power and motion. Cast iron synchronous pulleys are mainly used in industrial equipment, mechanical transmission and automation systems, and are widely used in various mechanical and engineering fields. The characteristics of cast iron synchronous pulleys include high strength, wear resistance, corrosion resistance, and good stability. They are generally suitable for high-load, high-torque, high-speed transmission applications, such as construction machinery, heavy equipment, wind power generation, conveying equipment, etc. Cast iron synchronous pulleys are usually selected according to parameters such as tooth shape, wheel edge diameter, and wheel edge width to meet different transmission needs. When selecting and using cast iron synchronous pulleys, attention should be paid to its material properties, such as the strength, wear resistance and corrosion resistance of cast iron, to ensure that it can withstand the stress and wear caused by high load and high speed transmission in use.
