According to our latest research, the global Castings and Forgings for Shipbuilding market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Castings and forgings for shipbuilding refer to the cast and forged components used in the construction of ships. These parts must possess high strength, durability, and corrosion resistance to withstand the harsh conditions of the marine environment. Castings are metal parts created by pouring molten metal into a mold and allowing it to cool and solidify into the desired shape. They are commonly used for components that require complex shapes or need to be wear-resistant and corrosion-resistant. Forgings are metal parts created by applying pressure to deform the metal, enhancing its physical properties. Forgings are typically used for components that require high strength and toughness.
