Abstracts

The global Catering Waste Gas Monitoring Platform market size is expected to reach \$ 560 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

The catering exhaust gas monitoring platform is a system used to monitor and manage oil fume emissions in the catering industry. It collects data on the working status of oil fume purifiers, oil fume emission concentration and other data in real time through monitoring equipment installed in catering companies, and transmits these data to the cloud platform. Regulatory authorities can use these data for real-time monitoring, promptly discover and deal with excessive emissions and equipment abnormalities, and urge catering companies to carry out rectification and regular maintenance to achieve environmental protection and emission reduction purposes. This kind of platform can help improve the environmental management efficiency of the catering industry and reduce the impact of oil fumes on the environment and residents' lives.

The market for restaurant exhaust gas monitoring platforms is experiencing rapid growth. With increasingly stringent environmental regulations, heightened corporate awareness of environmental compliance, and increased public attention to emission standards in the catering industry, industry demand is primarily focused on real-time emission monitoring, online gaseous substance analysis, comprehensive monitoring of environmental parameters such as flue gas temperature and humidity, as well as data visualization, early warning, and source tracing capabilities. Market competition focuses on sensor accuracy, equipment stability, data transmission and cloud analysis capabilities, system integration, maintenance costs, and regulatory compliance. Future trends include more integrated solutions, low-power and wireless deployment, simultaneous monitoring of multiple gases, and deep integration with intelligent

emission management and energy efficiency optimization.
