Abstracts

The global Cathode Copper market size is expected to reach \$ 279338 million by 2032, rising at a market growth of 3.0% CAGR during the forecast period (2026-2032).

Cathodic copper refers to high-purity copper produced from copper concentrate through electrolytic refining or electrolytic deposition methods, also known as refined copper or refined copper. The national standard GB/T 467-2010, the European standard BS EN 1978:1998, and the American standard ASTM B115 are all industry standard specifications for cathode copper. At present, the smelting process of cathode copper is mainly divided into pyrometallurgical (flash) smelting and hydrometallurgical smelting: pyrometallurgical smelting refers to the production of cathode copper, namely electrolytic copper, through melting smelting and electrolytic refining, which is generally suitable for high-grade copper sulfide ore and accounts for about 85% of the world's copper production. Wet smelting is suitable for low-grade complex ores and oxidized copper ores, and the refined copper produced is electrolytic copper, with lower smelting costs.

Due to its excellent conductivity, thermal conductivity, ductility, corrosion resistance, wear resistance and other characteristics, cathode copper is processed downstream into copper wire, copper rod, copper strip, copper foil, copper tube and various alloy products, which are widely used in industries such as power, electronics, transportation equipment, machinery manufacturing, construction industry, national defense industry, medicine, organic chemistry, etc. In 2025, global Cathode Copper production reached approximately 28,207 K MT, with an average global market price of around US\$ 7,762 per MT.

Cathode copper is one of the most essential raw materials in the global non-ferrous

metal system. In terms of demand, traditional wire and cable, building electrical, home appliance, and machinery manufacturing are still the basic industries. However, new demand is clearly shifting towards areas such as power grid upgrades, new energy vehicles, charging piles, photovoltaics, wind power, energy storage, data centers, AI servers, and electronic copper foils. In particular, electrification and energy transformation have increased the copper intensity per unit of GDP. Copper prices have fallen from their high levels in 2021-2023, and will strengthen again in 2024-2025 driven by tight mine supply, energy transformation demand, growth in AI data center electrical equipment, and financial fund allocation. The growth rate of cathode copper sales in the future is expected to remain moderate, but the price center may remain high, and the premium space for high-purity, low impurity cathode copper that can be used for copper foil and high-end electronic and electrical materials will be more obvious. Overall, the cathode copper market is not a high-speed growth market, but a typical 'low growth, high-value, high volatility, high strategic attribute' market. The focus of enterprise competition will shift from simple capacity expansion to resource guarantee, smelting efficiency, recycled copper utilization, green low-carbon smelting, and high-end electronic product upgrading.
