Abstracts

A cDNA library is a combination of cloned cDNA fragments inserted into a collection of host cells. It uses mRNA as a template, catalyzed by reverse transcriptase, reverse transcribed into cDNA in vitro, and ligated with an appropriate vector (commonly used phage or plasmid vector) to transform the recipient bacteria. Each bacteria contains a piece of cDNA and can reproduce and expand. In this way, the collection of cDNA clones containing all the mRNA information of the cell is called the cDNA library of the tissue cell. cDNA libraries specifically reflect the genes encoding proteins expressed in specific tissues or cells at specific developmental stages, so cDNA libraries are tissue- or cell-specific.

According to our (Global Info Research) latest study, the global cDNA Library market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
