Abstracts

Celiac disease is a digestive disorder that causes the body to have difficulty absorbing nutrients like fat, calcium, iron, and folate. It is an autoimmune disease in which gluten-containing foods cause damage to the small intestine lining. Celiac disease is diagnosed using a combination of serologic tests, small bowel biopsy, and a gluten-free diet response. Several serologic antibody tests can be used as initial tests. Antigliadin antibodies are no longer recommended for initial testing due to their low sensitivity and specificity.
