## Abstracts

Cell signaling is a transmission of molecular signals between the cells. Cells often receive many signals from the surrounding cells to ensure an appropriate response. Classical biochemical assays are used to quantify the signaling responses between the cells. However, in some instances, due to complex signaling pathways between the cells, few signal pathways may be overlooked during the testing process. Furthermore, lack of knowledge about orphan receptors cell signaling pathways is also inhibiting the drug discovery process. To overcome these companies developed label-free technologies that can understand the interactions between the cells by measuring cellular response. Previously, traditional cell-based label technologies are commonly used to screen new drugs for various therapeutic areas. However, undesirable results, need of tags, dyes and compromise screening are forcing companies to develop cell-based label free monitoring technologies. Owing to its high sensitivity, less complex process, and cost-effectiveness in drug discovery process cell-based label-free technologies are gaining traction over the years. Furthermore, they are used to understand the complex signaling pathways, quantify the affinity between cells and drugs, and to access difficult target classes.

### SCOPE OF THE REPORT:

This report studies the Cell-Based Label Free Monitoring market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Cell-Based Label Free Monitoring market by product type and applications/end industries.
