In 2025, the global production capacity of Cell Compression Pad was approximately 1.05 billion units.

Cell Compression Pad is a functional component used in lithium-ion battery packs to provide mechanical compression, vibration absorption, thermal expansion compensation, and structural protection for battery cells. It is mainly manufactured from foam materials, elastomers, insulation materials, or composite materials with controlled compression performance and durability. The product is widely applied in electric vehicle battery packs, energy storage systems, and high-performance battery modules. The product scope includes compression pads installed between cells or modules while excluding battery separators and general thermal interface materials.

The industry chain includes upstream suppliers of polymer foams, silicone materials, adhesive materials, insulation films, and functional additives. Midstream covers material formulation, precision cutting, molding, lamination, and quality inspection. Downstream applications include electric vehicles, energy storage systems, battery modules, and power battery assembly requiring mechanical stability and safety performance.
