## Abstracts

According to our (Global Info Research) latest study, the global Cell Cryopreserving Agent market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Cell culture are prone to genetic drift, which are susceptible to microbial contamination. The microbial contamination can lead to experiment failure in laboratories. Beside the cell line are very valuable resource and replacing the cell line will be too costly and time consuming during the experimentation. The best method to store cell line with minimum cost is freezing. The freezing method will enable the long term storage of cell which can be utilized when required in the laboratories. When the small surplus are available for sub culturing, it should be frozen as seed stock therefore duplicates can be obtain when require during experimentation. Cryopreserving is the most widely used method for the preservation of cell culture. In cryopreserving method the cell lines are stored in liquid nitrogen to avoid the microbial contamination. The presence of cryopreserving agents such as dimethylsulfoxide (DMSO) allows slower cooler rate and reduce the rate of ice crystal formation.

North America holds a dominant position in the global market,owing to increasing demand for in vitro fertilization (IVF) procedures in the U.S.
