Abstracts

Cell culture is a complex procedure in which cells are grown under controlled physical conditions outside the natural environment. These cells are used to develop model systems for research, study of cellular structure and functions, stem cell research, drug discovery and genetic engineering. Growing scope of cell culture and its applications has led to increased use of protein coated surfaces, as these provide better adhesion and proper nutrition for growth of the cells during cell culture. Scope of the Report:

This report focuses on the Cell Culture Protein Surface Coating in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Rising investment by government and market players in stem cell research and development activities is one of the major factors driving the cell culture protein surface coatings market. Becton, Dickinson and Company grants a total of USD 100,000 worth reagents every year to 10 scientists pursuing research activities in stem cells. Similarly, the European Union funded four stem cell research projects in its Seventh Framework Program for Research and Technological Development (2007 - 2013). High funding is leading to extensive stem cell research, resulting in increased use of cell culture protein surface coating products. Moreover, diverse applications of stem cells such as development of bone grafts and artificial tissue would fuel the demand for cell culture protein surface coatings during the forecast period. In addition, increasing cell culture applications in toxicology studies and cell-based assays would boost the demand for protein surface coating products. Currently, 2D cell culture is the most preferred technique by researchers worldwide due to lack of compelling data to switch to 3D cell culture.

The Americas accounted for the majority market share during 2016 and will continue to dominate the market during the forecasted period. The presence of highly developed healthcare infrastructure and the increasing demand for stem cell therapies and regenerative medicines for orthopedics, neurology, and autoimmune therapies are some of the major factors responsible for the market's growth in this region. The worldwide market for Cell Culture Protein Surface Coating is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
