## Abstracts

Cell-Free DNA are fragments of DNA which circulate in the blood fluid and can be utilized as valuable biomarkers. It is a new technology in which small quantity of liquid sample (saliva, urine, or blood) from the patient is collected to examine the freely flowing DNA. Cell-Free DNA (cfDNA) is a noninvasive screening test used to help detect graft rejection, identify mutations in cancer patients and detect various chromosomal abnormalities in the fetus, to know the gender of the fetus. The discovery of cfDNA has opened up to new potentials in the field of oncology, gynecology, transplantation and infectious diseases.
