According to our (Global Info Research) latest study, the global Cell-Free DNA (cfDNA) Testing market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Cell-Free DNA are fragments of DNA which circulate in the blood fluid and can be utilized as valuable biomarkers. It is a new technology in which small quantity of liquid sample (saliva, urine, or blood) from the patient is collected to examine the freely flowing DNA. Cell-Free DNA (cfDNA) is a noninvasive screening test used to help detect graft rejection, identify mutations in cancer patients and detect various chromosomal abnormalities in the fetus, to know the gender of the fetus. The discovery of cfDNA has opened up to new potentials in the field of oncology, gynecology, transplantation and infectious diseases.

Increased incidences of diseases like chromosomal abnormalities due to increasing maternal age, changing lifestyle, unhealthy diet habits and rising prevalence of cancer, also in addition to it increasing healthcare expenditure, and rising healthcare awareness are the reasons driving the cell-free DNA market.
