Abstracts

Cell imaging is the study of examining cell structures through various devices such as microscopes to better understand cellular mechanisms to help diagnose diseases and discover drugs. There are several methods of cell imaging, which include fluorescence microscopy (FM), high content screening (HCS), in situ hybridization (ISH), confocal laser scanning microscopy (CLSM), immunofluorescence imaging (IFI), super-resolution microscopy (SRM), and automated imaging. Some critical factors such as the maintenance of healthy cells at the microscope stage and the establishment of a feasible environment that is ideal for cells and does not affect their functionalities need to be ensured during cell imaging.

Scope of the Report:

This report focuses on the Cell Imagers in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. One of the key drivers that will stimulate the growth of the market in the coming years is the increasing demand for high content screening techniques. Automated microscopy, multi-parameter image processing, and unique visualization tools are increasingly used in analytical methods such as high content screening (HCS) or high content analysis (HCA) to generate quantitative data from cells. HCS is used to analyze data such as the number of cells or shape of the cell to detect changes in the reporter genes. HCS methods are also used to measure the mitotic index, detect changes in the cell cycle, detect protein synthesis, and measure the amount of cell proliferation. The growing disease burden is increasing the need for personalized medicine that requires advanced techniques such as HCS. This in turn, will drive the demand for cell imaging solutions

during the predicted period.

The Americas is witnessing a high demand for cell imagers and this is mainly due to the rising prevalence of chronic diseases in the region. The increase in chronic diseases will fuel growth in the pharmaceutical and biotechnology industries. These industries highly adopt cell imagers to carry out research activities in cancer cells. The cell imagers market will continue to grow in this region due to significant investments in research and testing activities in countries such as the US.

The worldwide market for Cell Imagers is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
