Abstracts

The global Cell Line Engineering Services market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Cell line engineering services is a biotechnology service that utilizes gene editing and cell culture technologies to edit and modify cells for various research and application needs. In this service, professional scientists design suitable gene editing schemes based on the customer's requirements and use gene editing tools such as CRISPR/Cas9 to precisely modify, insert, or delete the target gene sequence. Through specific cell culture techniques, the modified cells can obtain superior phenotypes and characteristics, such as higher product yield, better growth characteristics, and higher immune response.

Cell line engineering services are mainly applied in the field of biomedicine, such as drug screening, immunotherapy, gene therapy, etc. Furthermore, since this technology can be applied to various types of cells and animal and plant cells, it can also be applied in fields such as food and agriculture, such as improving the disease resistance of some plants and improving the quality of certain meat products.
