According to our (Global Info Research) latest study, the global Cell Lysis market size was valued at USD 2698.3 million in 2023 and is forecast to a readjusted size of USD 4619.7 million by 2030 with a CAGR of 8.0% during review period.

Cell lysis is vital step for study or research in proteomics, as protein can only be extracted if the cell lysis process is conducted. Furthermore, cell lysis is crucial step required to perform for nuclear extraction, after which the DNA is modified using the recombinant DNA technology.

The growing popularity of personalized medicines is one of the key factors driving the growth of this market in the next few years. The development of personalized medicine contributes to the exploration of new therapies for genetic anomalies. Genome mapping studies and the application of whole genome technology is extensively necessary to develop personalized medicines. The process of cell lysis is equally necessary to develop personalized medicine. Cell disruption is carried out to understand the interaction of cells. This helps researchers to develop or alter the structure of drugs to treat diseases. Additionally, the focus of the researchers to come up with new techniques such as reverse phase protein array (RPPA) technology for protein extraction to develop personalized medicine will also drive market growth since this technique involves homogenized cell lysis, which is performed using various methods.
