Abstracts

Cellular imaging is a technology used to detect and analyze organelles and macromolecules with the help of microscopy and computer programming. It also helps in measuring properties of cells including shape, size and protein presence. Cellular imaging also helps in knowing biomolecules nature. Confocal laser scanning microscopy, fluorescence resonance energy transfer and multiphoton are some of the advanced cellular imaging techniques which helps in understanding molecular and functional systems in the cell. Hospitals, academic institutions, pharmaceuticals and biotechnology companies uses cellular imaging systems as an important tool for drug discovery, research and diagnosis. Cellular imaging also helps in generating high throughput mode to discover the biomarkers and drug target candidates. Microscopic and macroscopic techniques are two types of intravital cellular imaging technologies.
