According to our (Global Info Research) latest study, the global Cellular Imaging market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Cellular imaging is a technology used to detect and analyze organelles and macromolecules with the help of microscopy and computer programming. It also helps in measuring properties of cells including shape, size and protein presence. Cellular imaging also helps in knowing biomolecules nature. Confocal laser scanning microscopy, fluorescence resonance energy transfer and multiphoton are some of the advanced cellular imaging techniques which helps in understanding molecular and functional systems in the cell. Hospitals, academic institutions, pharmaceuticals and biotechnology companies uses cellular imaging systems as an important tool for drug discovery, research and diagnosis. Cellular imaging also helps in generating high throughput mode to discover the biomarkers and drug target candidates. Microscopic and macroscopic techniques are two types of intravital cellular imaging technologies.

North America is the largest market for cellular imaging followed by Europe due to increasing incidence of cancer and rising number of R&D activities.
