Cellular low pass filters are electronic components that are designed to suppress high-frequency noise and harmonics from interfering with cellular communication signals. These filters have a low insertion loss for the passband frequencies of interest, such as the frequency bands used for 4G LTE and 5G wireless communications. They are commonly used in base stations, repeaters, and distributed antenna systems (DAS) for cellular networks to ensure reliable and efficient communication.

Cellular low pass filters can be implemented using various technologies such as surface acoustic wave (SAW) filters, ceramic filters, or cavity filters, depending on the specific application requirements. These filters may have different specifications such as frequency range, insertion loss, return loss, power handling capacity, and size, among others.
