Abstracts

According to our (Global Info Research) latest study, the global Cellulose Nanofibers (CNF) market size was valued at USD 92 million in 2023 and is forecast to a readjusted size of USD 385.1 million by 2030 with a CAGR of 22.8% during review period.

The terms cellulose nanofibrils and microfibrillated cellulose are being used interchangeably. There is considerable overlap in specifications, many of these materials contain a mix of nano-scale and micro-scale particles. Some producers prefer to call their material “nano” because it sounds more advanced, while others prefer to call it “micro” because of perceptions about environment, health, and safety issues. Both CNF and MFC are generally included in discussions of cellulose nanomaterials.

The properties of nanocellulose listed below: Lightweight, Stiffer than Kevlar®, Electrically conductive, Non-toxic; The crystalline form is transparent, and gas impermeable; It can be produced in large quantities in a cost-effective manner; it has a very high tensile strength - 8 times that of steel; it is highly absorbent when used as a basis for aerogels or foams; the raw material - cellulose - is the most abundant polymer on earth.
