In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Cement-based penetrating crystalline waterproofing coating is a type of waterproofing material formulated by blending cement with special reactive chemicals. It introduces these special reactive chemicals into the cement matrix, which, upon contact with water, undergo chemical reactions to form water-insoluble crystalline structures. These structures gradually penetrate into the micro-cracks and pores of the concrete structure, creating a dense waterproof layer. This waterproofing coating not only effectively prevents water penetration but also enhances the strength and durability of the concrete structure. Its unique penetrating crystalline mechanism ensures a tight bond between the coating and the substrate, such that even if the coating surface undergoes wear or damage, the internal crystalline structures continue to function, maintaining long-term waterproofing effectiveness. Cement-based penetrating crystalline waterproofing coating is widely used in waterproofing applications for building components such as basements, rooftops, bathrooms, and swimming pools, as well as in infrastructure projects like tunnels and bridges. It is easy to apply, allowing for direct brushing or spraying onto concrete surfaces without the need for complex waterproof layer construction, significantly reducing construction time and costs. Additionally, this coating

boasts excellent environmental performance, being non-toxic, harmless, and pollution-free, aligning with the requirements of modern green building practices.
