According to our (Global Info Research) latest study, the global Centralized Converter Boost Integrated Machine market size was valued at US\$ 612 million in 2025 and is forecast to a readjusted size of US\$ 819 million by 2032 with a CAGR of 4.3% during review period.

In 2025, the global production of centralized converter-boost integrated power supply units reached 6,266 units, with an average selling price of US\$95,000 per unit. The global annual production capacity of centralized converter-boost integrated power supply units is approximately 12,000, with a gross profit margin of approximately 30.1%. A centralized converter-boost integrated power supply unit is a device that integrates a converter, boost converter, and control system. It is specifically designed to efficiently convert energy from photovoltaic power generation, energy storage, or other DC power sources into AC power and boost the voltage for grid connection or load supply. The upstream of the centralized converter-boost integrated power supply unit industry chain includes high-efficiency input/output conversion conductive materials, heat dissipation materials, insulating materials, high-power MOSFETs/IGBTs/diodes, etc.; the midstream consists of centralized converter-boost integrated power supply unit manufacturers; and the downstream applications are mainly in energy storage systems, power plants, and other industries.

The centralized converter-boost integrated unit market is currently experiencing both rapid development and profound transformation. Driven by the 'dual-carbon' strategy, the booming new energy industry has created vast application opportunities for this equipment, making it an indispensable key component in new energy power generation, energy storage systems, and other fields. With its highly integrated design, this

equipment combines converter, boost, and control functions into one unit, significantly improving deployment efficiency, space utilization, and ease of operation and maintenance, while reducing system losses and total lifecycle costs, offering clear advantages over traditional split-type solutions. In terms of market competition, the industry has formed a pattern of 'leading companies and multi-polar competition.' Leading companies dominate the high-end market with their full-chain technology integration and global layout, while companies in niche sectors seize specific market shares through differentiated technologies and in-depth cultivation of application scenarios. Furthermore, strong policy support and the continuous release of market demand have further promoted the technological iteration and application scenario expansion of this equipment, enabling it to play an even more crucial role in the construction of new power systems in the future.
