## Abstracts

Centrifugal Barrel Tumbling Machine is a high-energy finishing method where Centrifugal Barrel Machines are used. These machines are typically made up of two or four individual barrels (or drums) mounted on the outer edge of a turret. The turret is rotated in one direction, causing the barrels to rotate in the opposite direction creating very high G-forces or pressures, as well as considerable media sliding action within the drums. The movement mimics that of a ferris wheel. This action is due to either a Timing Belt, V-Belts or Chain that is connected between the main shaft and the centerline of the 4 barrels. In operation, this turret rotation creates a high centrifugal force. This force compresses the load into a tight mass causing the media and parts to slide against each other removing burrs and creating a superior finish. Short cycle times are realized as a result of the high centrifugal energy being applied to the parts.

Barrel tumblers work well for jobs requiring heavy burr removal. They are also good for burnishing, rapid radiusing of edges, heavy deburring with or without media and tumbling die-castings to break the parts off the runner.
