Abstracts

According to our (Global Info Research) latest study, the global Centrifugal Booster Pump for CCUS market size was valued at US\$ 255 million in 2025 and is forecast to a readjusted size of US\$ 429 million by 2032 with a CAGR of 5.5% during review period.

A Centrifugal Booster Pump for CCUS is a specialized high-pressure pump used to maintain or increase the flow and pressure of carbon dioxide (CO₂) within long-distance pipelines, typically in carbon capture, utilization, and storage (CCUS) systems. As CO₂ travels through pipelines, often in a supercritical or dense phase, its pressure naturally drops due to friction and elevation changes. Booster pumps are strategically installed along the pipeline to recompress the CO₂ and ensure it remains in the desired phase and at a pressure sufficient for safe, efficient transport to storage sites or utilization points. These pumps are designed to handle corrosive, high-density CO₂ fluids, and must operate reliably under high pressure and varying temperature conditions. The average price of this product is approximately US\$1,700 K per unit, with annual sales of approximately 150 units.

Upstream for a Centrifugal Booster Pump for CCUS mainly involves raw material and component suppliers such as specialty steels and alloys, castings, seals, bearings, and drive systems, along with engineering and manufacturing inputs, while downstream consists of EOR contractors and end users in CCUS projects including long-distance CO₂ pipeline transport operators, carbon storage developers, and enhanced oil recovery operators who integrate and operate the pumps within compression and injection systems.
