According to our (Global Info Research) latest study, the global Centrifugal Solid-Liquid Separator market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A centrifugal solid-liquid separator is a commonly used industrial equipment used to separate solid particles from liquids in a mixture. It uses centrifugation to separate solid particles whose gravity is greater than the liquid phase from the mixture. The main working principle of the centrifugal solid-liquid separator is to use the rotating centrifugal barrel to generate centrifugal force. Under the action of the centrifugal force, the solid particles are deposited on the wall of the centrifugal barrel by the outward centrifugal force, forming a solid sediment; while the liquid appears Similar to the state of free liquid surface, a liquid surface is formed in the center area of the centrifuge barrel. By adjusting the speed and operating parameters of the centrifuge, the effect of solid-liquid separation can be controlled. Centrifugal solid-liquid separators are widely used in chemical, pharmaceutical, food, environmental protection and other industries to process suspensions, suspended solutions, slurries and other mixtures to achieve separation of solids and liquids. It has the advantages of simple operation, large processing capacity, and good separation effect, and has important application value for processing liquids containing solid particles.
