Abstracts

The ceramic capillary is an axisymmetric ceramic tool with a vertical center hole, which is used for wire bonding packaging of LEDs, diodes, triodes, IC chips and other circuits. Wire bonding is the main technology for the electronic interconnection of chips and pins, accounting for 75%-80% of package types. Other commonly used technologies include flip chip, wafer level packaging (WLP) and through silicon via (TSV), etc. . The wedge is one of the core components used in wire bonding technology. In this process, the tail of the metal wire (usually gold or copper wire) passing through the wedge is melted into a spherical shape by the flare rod, and the wedge is lowered and passed through Pressing and heating causes the ball to be soldered on the chip, and then the wedge pulls the metal wire up, moves and solders it on the lead frame, and then cuts the metal wire laterally, which completes a bonding. Compared with wedge knives made of tungsten carbide, titanium gold and other materials, ceramic wedge knives have the advantages of high hardness, high mechanical strength, fine grains, high surface finish, high dimensional accuracy, and long service life.
