## Abstracts

The global Ceramic Composite Resistor market size is expected to reach \$ 670.2 million by 2029, rising at a market growth of 7.4% CAGR during the forecast period (2023-2029).

Ceramic Composite Resistors consist of a mixture of finely ground insulators and conductors, compressed into a cylindrical shape. Connect the terminals and apply an insulating coating to the outer body of the resistor. Resistance is controlled by the ratio of insulator to conductor mixture. Ceramics are excellent electrical insulators as well as excellent thermal conductors. This property of ceramics allows the core of these resistors to withstand low to moderate power currents flowing through them without overheating and damage. By their nature, ceramic resistors are also very chemically inert. The uses of ceramics are not limited to the internal components of resistors. Ceramic insulation and thermal properties will insulate and maintain greater heat resistance on the outside than many other types of resistors. The top five manufacturers of ceramic composite resistors are KOA Corporation, Ohmite, Te Connectivity, Vishay, and Vikingcor, which together account for about 40%. There are different product types of ceramic composite resistors, among which the category of ceramic composite resistors below 5W occupies the first market segment, accounting for 41.57%. The top three application fields of ceramic composite resistors are industrial, medical, and communication, accounting for 18.3%, 14.78%, and 14.68% respectively.

Ceramic Composite Resistors consist of a mixture of finely ground insulators and conductors, compressed into a cylindrical shape. Connect the terminals and apply an insulating coating to the outer body of the resistor. Resistance is controlled by the ratio of insulator to conductor mixture.
