A Ceramic Corona Discharge Ozone System is a type of ozone generator that utilizes a ceramic material as the dielectric material in the ozone generation process. The ceramic material provides insulation and allows for controlled corona discharge.

The Ceramic Corona Discharge Ozone System typically consists of two electrodes inside a ceramic tube or plate. When a high voltage is applied to the electrodes, a corona discharge is initiated within the ceramic material, converting oxygen (O₂) molecules in the surrounding air into ozone (O₃) molecules. Ceramic corona discharge ozone generators are known for their durability, reliability, and stability in ozone production. The ceramic material offers excellent insulation properties, allowing for efficient and controlled ozone generation. They can produce ozone at high concentrations with a lower risk of electrical breakdown or arcing. These ozone generators are commonly used in various applications such as water treatment, air purification, and industrial processes that require ozone for oxidation or disinfection. They are suitable for continuous or intermittent ozone production, offering long-lasting performance even in harsh environmental conditions.
